I cant find where to turn this in on brightspace?

revise, edit, and follow current MLA formatting

2) meet the minimum length requirements indicated in the assignments; and

3) include an original title and a heading with your name, our section number, a word count (not including the works cited and citations), the assignment type, and the date.

If you could control your destiny, would it be in a fantastical kingdom, or the cockpit of a hulking, durable, mechanical robot? With tabletop roleplaying games, you play as a persona in a power fantasy and take charge in an adventure. The setting changes depending on which gameplay system. For things like Dungeons and Dragons, which has been popularized by media like Stranger Things, Baldur's Gate, and Critical Role, you are in a magical fantasy world. At its most basic, you can cast spells and swing swords on an adventure to potentially save the kingdom. LANCER, is a newer player in the world of tabletop rpgs. In this niche game you play as an expert mech pilot, firing bullets and also swinging swords on an adventure to potentially save one of many worlds. How both systems go about character creation is what really affects their gameplay. NO THESIS ALERT! NO THESIS ALERT

In Dungeons and Dragons 5.5th edition, character creation is slightly random. You roll 4 dice with 6 sides. Then remove 1 die with the lowest number. Add the remaining totals up to get 1 number. You do this 6 times in order to get the values to apply to your character's main abilities. Strength, Dexterity, Constitution, Intelligence, Wisdom, and Charisma. There are less random ways to get your numbers, but it is a great intro to uncertainty that could affect your interactions. This randomness contributes to each character you make feeling unique. There is a chance you get great rolls for every stat, while other times you end up with a character who has 7

constitution. Then comes your species abilities. Due to your character's chosen species, you may get some special ability. Dragonborn have resistance to a chosen element from their lineage, Orcs don't get downed the first time they get reduced to 0 hitpoints, and more. There are 11 base species to choose from, making the world feel vibrant and full of life. Next is your background. As a person in a society your character has something they used to do. Maybe a soldier, maybe a scholar. Your background gives special skills, character ideas, and potential starting equipment.

Add more about this (bioessentialism)

The last portion is your character's class. FIghter, Warlock, Paladin, Sorcerer, etc. However, the age of the game means there are many ideas about how to play already up in the air. The prevalence of these stereotypical playstyles can feel stifling. Players may find themselves stuck in a rut of the same few classes over and over again. An orphaned rogue with darkness in their heart, a genius elven wizard, a heroic human fighter. Players are unconsciously inundated with these basic character ideas, meaning they could fall a little flat. The roleplay can be railroaded by the beaten path, causing repetitive][][][][][. Another drawback, lots of the basics are old enough that they seem cliche. Undead villains, fantasy kingdoms, evil cults. Similar stories over and over. Similar world building. So old that this text I have at the very bottom of my screen makes the same points that are relevant today. Not necessarily a bad thing. Look at that staying power. I got this.

However LANCER has a different approach. Your background only matters for story purposes. The creators want to emphasize the beauty of humanity's differences. You could be from a colony, a soldier, a scientist. But your past doesn't define you. It just shapes the setting for

how you became an expert mech pilot. A Lancer. [TOM BLOOM TALKIN ABOUT ONLY HUMAN] As a Lancer, you are one in a billion in terms of skill. And more skilled with making different kinds of mechs. In the game you get points to upgrade your HASE attributes. H for hull, how robust and tanky your mech are. A for agility, how quick and mobile your mech is. S for systems, how well do your computers work. And finally E, for engineering. It represents how well you can push your mech to their reactors limit, [Fear is a choice but the choice is mine.] But how do you get your machines? In the world of Lancer, there are 5 megaconglomerates that give you blueprints to make your own, once you prove your worth. The leveling up system in Lancer portrays it in a way that you are getting more renown, more famous. The corpos trust that you can handle their pride and joys. Each license gives weapons, systems, or frames for you to add to or make your mech. You get options to adjust your mech to your playstyle and mission type. .The system is more built for combat, which can be surprisingly full of character building aspects. In the setting of Lancer, there are only humans. “Quote by the creators explaining why.” This is an interesting aspect into fart and poop. Humans are good and cool. But also evil and icky. We can choose the easy path of shoving bad stuff onto other people, or face our wrongdoing as a species that we can do. Isnt that cool. Yes it is adam. Im also very tired, but happy im actually writing something down. I feel much better. Yay. anyway. As a pilot, you have things you are good at. You are talented in different areas of mech combat. Shown by the talents. You might be good at hitting people with big swords, which slowly helps build you into a direction you want. You you you. Besides melee combat, there are the futuristic versions of spells. In the world of lancer, they have conscious code. Nhp explanation. Very cool. How they can do magic, while still seeming like normal irl stuff. Everyone uses the unknown space magic, it comes free with your fcking smart fridge.

In conclusion, I don't have a thesis just yet, so I can't really write it. Both systems are good though. Im so freaking sorry I don’t have a thesis yet. Very rough draft. Errrm. I'm doing things out of order but I will hopefully have a really good essay at the end of this. I just cant put my ideas into a thesis rn. Toodleoo! Feeling like spaghetti. Not even 1500 words 😕
